

A solar panel system

Overview

A solar panel is a device that converts light into electricity by using multiple solar modules that consist of (PV) cells. PV cells are made of materials that produce excited electrons when exposed to light. These electrons flow through a circuit and produce direct current (DC) electricity, which can be used to power various devices or be stored in a battery. Solar panels can be monocrystalline, polycrystalline, or thin-film.

A photovoltaic system consists of one or more solar panels, an inverter that converts DC electricity to alternating current (AC) electricity, and sometimes other components such as controllers, meters, and trackers.

A solar panel system

[Homeowner's Guide to Going Solar , Department of Energy](#)

When the sun shines onto a solar panel, photons from the sunlight are absorbed by the cells in the panel, which creates an electric field across the layers and causes electricity to flow.
