

# Advantages and disadvantages of double glass silicon modules

**5 Years warranty**

## Overview

---

Their double-sided design and durability provide better long-term performance, but higher upfront costs and specific installation requirements may limit their widespread adoption. Why are double glass modules symmetrical?

Mechanical constraints on cells: the fact that the structure of the double glass modules is symmetrical implies that the cells are located on a so-called neutral line, the upper part of the module being in compression during a downward mechanical load and the lower glass surface being in tension.

Are bifacial double-glass modules a good choice?

There has been a noticeable shift from the initial single-facial single-glass modules to bifacial double-glass modules. Double-glass modules, with their performance in the face of salt mist, high temperatures and high humidity, have won the market's favour. However, this trend is not without its risks.

What is a dual-glass module?

Dual-glass type modules (also called double glass or glass-glass) are made up of two glass surfaces, on the front and on the rear with a thickness of 2.0 mm each. Some manufacturers, in order to reduce the weight of the modules, have opted for a thickness of 1.6 mm. DualSun has chosen to stay with a thickness of 2.0 mm for reasons explained below.

How do solardeland bifacial double glass panels work?

This traditional design focuses only on capturing sunlight from the front. Solardeland bifacial double glass panels are designed to capture sunlight from both sides. They are enclosed between two layers of tempered glass, allowing the back to absorb reflected light from the surrounding surfaces.

What is double glass encapsulation?

Hermetic encapsulation: the double glass modules offer a hermetic structure,

resistant to aggressive weather conditions, the main one being moisture penetration highlighted during tests so-called Damp Heat, according to standard IEC 61215-2: 2021 (clause MQT13).

What is the difference between bifacial and double glazed panels?

The double-glazed design gives them a transparent or translucent appearance, which is different from the opaque single-sided panels. Main difference: The design of single-sided panels is simpler and lighter, while bifacial double-glazed panels are heavier and have a more complex and modern appearance due to the double-glazed structure. 2.

## Advantages and disadvantages of double glass silicon modules

---

### Single-glass versus double-glass: a deep dive into module ...

Double-glass modules, with their performance in the face of salt mist, high temperatures and high humidity, have won the market's favour. However, this trend is not ...

[Product Information](#)

### What are the advantages and disadvantages of dual glass solar ...

A new process has emerged that uses glass on both the surface and back, known as double-sided glass solar modules, commonly known as double-glass solar panels. Replacing other ...

[Product Information](#)

### What advantages does double glass solar photovoltaic panels ...

Double-sided modules are photovoltaic modules that can generate electricity on both sides. When the sun shines on double-sided modules, part of the direct solar radiation and scattered light ...
