

# Can the batteries in the battery cabinet be used directly

## Overview

---

Can a lithium-ion battery cabinet withstand a fire?

You should ensure all storage cabinets for lithium-ion batteries are rated for fires starting from inside the cabinet. Without this, the protection is inadequate. The cabinet must withstand an internal fire for at least 90 minutes; it must be tested and approved to SS-EN-1363-1 for internal fire. 2. Ensure that your cabinet has integral ventilation.

Do lithium ion batteries need a battery room?

Lithium-ion batteries need a battery room if their capacity exceeds 20 kWh, according to fire codes. NFPA 855 outlines ventilation and safety requirements. Store batteries at a temperature of 59°F (15°C). Also, refer to NFPA 70E for further safety guidelines, and ensure proper exhaust ventilation for off-gas events.

What are the safety requirements related to batteries & Battery rooms?

Employers must consider exposure to these hazards when developing safe work practices and selecting personal protective equipment (PPE). That is where Article 320, Safety Requirements Related to Batteries and Battery Rooms comes in.

Are there guidelines for storing lithium-ion batteries at home?

Yes, there are unique guidelines for storing lithium-ion batteries at home. Proper storage practices ensure the safety and longevity of the batteries. These guidelines help mitigate the risks of fire, overheating, and reduced battery lifespan. Storing lithium-ion batteries requires attention to temperature, humidity, and physical conditions.

Should a storage cabinet be used as a charging station?

If the storage cabinet is likely to be used as a charging station, it should be built explicitly for this purpose and include all the critical safety measures that

are needed for this from the outset. It can be more expensive and dangerous to connect charging facilities yourself at a later stage.

What are the best practices for storing batteries?

Best practices include using battery cabinets with ventilation holes or ensuring that rooms where batteries are stored have sufficient air circulation. Storing batteries in a non-conductive container protects them from accidental short circuits. Containers made from materials like polypropylene or high-density polyethylene are ideal.
