## ENERGY STORAGE SYSTEM

**Product Model**  
HJ-ESS-215A(100KW/215KWh)  
HJ-ESS-115A(50KW 115KWh)

**Dimensions**  
1600\*1280\*2200mm  
1600\*1200\*2000mm

**Rated Battery Capacity**  
215KWH/115KWH

**Battery Cooling Method**  
Air Cooled/Liquid Cooled

The advertisement features a white, rectangular Flow Battery Scale unit with a control panel on the left side. The unit is shown against a light background. The background of the entire advertisement is a scenic landscape with a large solar panel array in the foreground, a small building, and snow-capped mountains in the distance.

## Overview

---

Associate Professor Fikile Brushett (left) and Kara Rodby PhD '22 have demonstrated a modeling framework that can help guide the development of flow batteries for large-scale, long-duration electricity storage on a future grid dominated by intermittent solar and wind power generators.

A flow battery contains two substances that undergo electrochemical reactions in which electrons are transferred from one to the other. When.

A major advantage of this system design is that where the energy is stored (the tanks) is separated from where the electrochemical reactions occur (the so-called reactor, which includes the porous electrodes and membrane). As a result, the capacity of the.

The question then becomes: If not vanadium, then what?

Researchers worldwide are trying to answer that question, and many.

A critical factor in designing flow batteries is the selected chemistry. The two electrolytes can contain different chemicals, but today.

Compared to inorganic redox flow batteries, such as vanadium and Zn-Br<sub>2</sub> batteries, organic redox flow batteries' advantage is the tunable redox properties of their active components. As of 2021, organic RFB experienced low durability (i.e. calendar or cycle life, or both) and have not been demonstrated on a commercial scale. Organic redox flow batteries can be further classified into aqueous (AORFBs) and non-aqueous.
