## Overview

---

Meet flywheel energy storage —the mechanical battery that’s giving lithium-ion a run for its money. Companies like Beacon Power and Amber Kinetics are turning this centuries-old concept (think pottery wheels!) into cutting-edge solutions for modern energy challenges [1] [5]. Why do we need advanced flywheel energy storage systems?

This brings us to the pressing need for innovative solutions such as Advanced Flywheel Energy Storage Systems (FESS), which offers a sustainable and efficient alternative. FESS offers unparalleled longevity and reliability, with lifespans exceeding 50,000 cycles and design lives of over 25 years.

What is a flywheel energy storage device?

Our flywheel energy storage device is built to meet the needs of utility grid operators and C&I buildings. Nova Spin, our flywheel battery, stores energy kinetically. In doing so, it avoids many of the limitations of chemical batteries.

What is the difference between a flywheel and a battery storage system?

Flywheel Systems are more suited for applications that require rapid energy bursts, such as power grid stabilization, frequency regulation, and backup power for critical infrastructure. Battery Storage is typically a better choice for long-term energy storage, such as for renewable energy systems (solar or wind) or home energy storage.

What is a flywheel energy storage system (fess)?

To solve this problem, London-based startup Levistor has developed an innovative Flywheel Energy Storage System (FESS), which acts as a kinetic battery. This technology stores energy from the grid during periods of low demand and releases it rapidly when an EV needs a quick charge. It can deliver 100 miles of range in just five minutes.

What is flywheel technology?

Flywheel technology is a method of energy storage that uses the principles of rotational kinetic energy. A flywheel is a mechanical device that stores energy by spinning a rotor at very high speeds.

What is a high efficiency flywheel energy storage system?

High Efficiency Flywheel energy storage systems offer high round-trip efficiency, typically around 85-95%. This means that a significant portion of the energy used to charge the flywheel can be recovered during discharge. 2. Rapid Response Time These systems provide a quick response to changes in energy demand.
