

How big a container should a solar collector be

Overview

What is the size of the solar collector I need?

Solar collectors come in standard sizes of 10, 12, 15, 18, 20, 22, 24, 25, or 30 depending on your region. If you need a collector size that is not standard, as a general rule, select the next size down to prevent having too much heat in the summer.

How many litres should a dedicated solar collector be?

According to the energy saving trust (CE131, Energy Saving Trust, 2006) the dedicated solar volume should be the greater of the expected domestic daily hot water use, or 35 litres per meter squared of net collector area. Now we know our dedicated solar volume we can work out the size of the collector required.

What size heat pipe solar collector do I Need?

To determine the appropriate size for a heat pipe solar collector, consider two key factors: insolation level and energy requirements. Energy requirement will usually take into account the volume of water and the desired rise in temperature.

What is the 'net' area of a solar thermal collector?

The 'net' area is the amount of collector exposed to the sun after the area of the frame has been deducted. So there we have it – the size of the solar thermal collector depends on the size of the dedicated solar volume of the cylinder.

How much hot water does a solar collector provide?

A bigger solar collector provides more hot water in the summer, but an economically sound decision should be made. It is generally wise to select a size that will provide 90% of your hot water needs in the summer.

What is the relationship between solar collector capacity and cylinder capacity?

The relationship between solar collector capacity and cylinder capacity is a critical one. If you get it right then you'll have a good spread of solar energy creating usable hot water over the year. Get it wrong and you'll either have an overheated cylinder in the summer or tepid water in the height of summer and no hot water in the winter at all!

How big a container should a solar collector be

Solar Collector Size Calculator

When you choose the size of solar collector, you must consider two key factors: insolation level and energy requirements. Energy requirement will usually take into account water volume and ...
