

Huawei bifacial crystalline silicon solar panels

Overview

What is crystalline silicon bifacial PV technology?

Crystalline silicon (c-Si) bifacial PV technology becomes the part of the equation to develop the practical PV technology that could produce higher energy at a lower cost since it is able to absorb irradiance from the front and rear sides for the same active area the conventional (monofacial) PV devices have.

What is a bifacial silicon solar panel?

The bifacial silicon-based cell architecture consists of PERC +, p -PERL, n -PERC, n -PERT, n -PERL, heterojunction, IBC and TOPCon cells. A typical bifacial silicon solar panel consists of a glass sheet on both front and back sides, a transparent polymer sheet and a thin silicon wafer layer with a shelf life of at least 25 years.

Are bifacial solar panels better than monofacial?

Under better albedo and proper mounting angles, a typical bifacial solar panel is expected to show 50% more power conversion efficiency than the monofacial counterpart. Bifacial silicon solar cells are monofacial cells with a back surface opened with a dielectric passivated layer, and a polymer back cover is replaced with a transparent sheet.

Why do bifacial solar panels increase power conversion efficiency?

The increase in the bifacial silicon solar cells is due to the reduction in silicon wafer thickness and the increase in the transparency of the panels. Under better albedo and proper mounting angles, a typical bifacial solar panel is expected to show 50% more power conversion efficiency than the monofacial counterpart.

What are bifacial solar cells?

The first bifacial solar cells were based on transistor-like structures, also

known as Transcell (TRC), with $n^+ - p - n^+$, $n^+ - p - p^+$ and $p^+ - n - n^+$ -structured bifacial cells [1, 2]. The front faces in these cells are conventional metal grid pattern patterns that contact the front n^+ / p^+ -homopolar emitter.

Which antireflective coating is used in bifacial solar cells?

4.1.1. Silicon nitride Silicon Nitride is the most reliable and commonly used antireflective coating and passivating material in monofacial solar cells. The antireflective coating properties are good and can act as an effective passivation layer on the front side of the bifacial solar cells.

Huawei bifacial crystalline silicon solar panels

[Commercial bifacial silicon solar cells](#)

The approaches used for the bifacial silicon solar panels include reducing the thickness of the silicon wafer into sub-micro/nano levels and improving the transparency of the ...
