

Large Series Solar System

Overview

These lists contain the Sun, the planets, dwarf planets, many of the larger small Solar System bodies (which includes the asteroids), all named natural satellites, and a number of smaller objects of historical or scientific interest, such as comets and near-Earth objects. Overview This article includes a list of the most massive known objects of the and partial lists of smaller objects by.

- | Object | Relative mass |
|---------|---------------|
| Jupiter | 71% |
| Saturn | 21% |

 Relative masses of the bodies of the Solar System. Objects smaller than are not visible at this scale.
- | Object | Relative mass |
|---------|---------------|
| Jupiter | 71% |
| Saturn | 21% |

 Relative masses of the Solar planets. at 71% of the total and at 21% dominate the system.

The following objects have a nominal mean radius of 400 km or greater. It was once expected that any icy body larger than approximately 200 km in radius was likely to be in (HE). However.

All imaged icy moons with radii greater than 200 km except are clearly round, although those under 400 km that have had their shapes carefully measured are not in hydrostatic equilibrium. The known densities o.
