

# **Lithium battery frequency modulation energy storage system**

## Overview

---

At present, the battery energy storage system mainly participates in primary frequency modulation by inertial control and sag control, both of which provide fast frequency support[8], and the latter helps to reduce the frequency deviation in the later stage of frequency modulation and improve the frequency stability [9]. This paper takes the frequency deviation as the adjustment object, considers the characteristics of lithium-ion energy storage battery, proposes a power grid primary frequency modulation model including lithium-ion battery energy storage system, comprehensively considers the control mode of the energy storage system, establishes a MATLAB simulation model, and verifies the positive impact of lithium-ion battery energy storage on primary frequency modulation through the frequency modulation indicators under different working conditions.
