

# **Microinverters vs Central Inverters**

## Overview

---

What is the difference between a central and a micro inverter?

Micro inverters are installed on each panel and function independently, while a central inverter is linked to multiple panels and converts electricity for the whole system. Overall, micro inverters can optimize power generation on a panel-by-panel basis, while central inverters are less expensive and easier to maintain.

Are solar micro inverters better than a central inverter?

Traditionally, central inverters—also called string inverters—have been the standard. However, Solar micro inverters have emerged as a strong competitor, especially in residential applications. Let's take a closer look at the pros and cons of each type. Central inverters are tried-and-true.

Are string inverters better than a micro inverter?

Moreover, the wiring for string inverters is less complicated, requiring fewer components than a micro inverter setup. The key disadvantage of a central inverter is its inefficiency in dealing with shade or dust on a single solar panel which can reduce the performance of your entire system.

Why should you choose a micro inverter?

This is much more difficult on a central inverter. The most interesting plus to micro inverters is the ability for each panel to be connected to a computer monitoring system so you can easily pinpoint which panel is experiencing lower efficiency rates. This is very helpful in discovering faulty panels or equipment.

What is a micro inverter?

Micro inverters gained traction in the market in the last couple of years, although micro inverters have been commercially produced since the 1990s. The micro inverter addresses many of the shortcomings of central inverters.

Micro inverters minimize the issue of one module in shade affecting the entire array.

Are central inverters worth it?

Despite their benefits, central inverters have limitations: Shading Sensitivity: If just one solar panel in a central inverter system is shaded, even partially, it can reduce the output of the entire array by as much as 50%. This makes central inverters less ideal for roofs with shading issues.

## Microinverters vs Central Inverters
