

# Morocco immersion liquid cooling energy storage

## Overview

---

What are the different types of immersion cooling systems?

Immersion cooling systems can be categorized into two categories: single-phase liquid cooling and two-phase liquid cooling. In a single-phase immersion cooling system, the dielectric fluid absorbs the heat released by the batteries without undergoing any phase change.

Does immersion liquid cooling work under high C-rate discharge?

The immersion liquid cooling technique demonstrates its effectiveness in efficiently absorbing heat generated by LIBs under high C-rate discharge, while maintaining an optimal temperature range of 34–35 °C. However, FAC fails to adequately fulfill the demands of LIBs thermal management under high C-rate.

What is a liquid cooling system?

The liquid cooling system comprise a condenser connected with external liquid loop (The coolant flow rate was kept at 8 L/min), a battery tank equid with a pressure meter (ZSE30AF, China), battery charge/discharge equipment (AODAN CD1810U5, China), a data acquisition instrument (FLUKE 2638A, USA), and an environmental chamber (GZP 360BE, China).

How efficient is two-phase immersion cooling system?

The results indicate that the utilization of two-phase immersion cooling system proved highly efficient in maintaining the cell temperature within the range of 34–35 °C across all tested conditions, exhibiting excellent temperature uniformity.

What is the temperature evolution of liquid-cooled batteries under intermittent charge/discharge process?

It is evident that the utilization of a two-phase immersion liquid cooling system enables consistent maintenance of battery temperatures at approximately

33–35 °C throughout the alternating charge/discharge process. Fig. 10. Temperature evolution of liquid-cooled batteries under intermittent charge/discharge process. 3.5.

What is the difference between forced convection cooling and immersion cooling?

Their findings revealed that under forced convection cooling, the temperature remained within the desired range only up to a discharge rate of 1.5C, whereas immersion cooling demonstrated satisfactory performance up to a discharge rate of 2C.
