

# PV panel prices under pressure

## Overview

---

Why do solar modules cost so much?

However, as the primary cost component of photovoltaic modules, the price of solar cells plays a decisive role in module pricing. Due to the oversupply of polysilicon in earlier periods, prices have been under sustained pressure since 2023, even falling below cost levels in the first half of 2024.

Will price fluctuations affect the photovoltaic module market?

As the global energy transition accelerates, the photovoltaic (PV) industry, as a key component of renewable energy, continues to attract significant attention for its promising development prospects. However, price fluctuations in the photovoltaic module market remain a critical factor influencing the industry's growth.

What impact will solar panels have on pricing?

The impact on pricing for home systems won't be very significant as the panel part of the total cost is not as significant these days. The major impact will be on grid scale solar farms. This may delay or halt some planned solar farms for six to twelve months.

Are solar panels a good investment?

As a solar installation business owner I've been told to expect a small price rise in panels soon. Not sure its a great idea for a major supplier to be disclosing wholesale pricing on such a public forum. I think prices will stay well within the range that makes PV a good investment.
