

Poland water pump inverter price

Overview

How does a pump inverter work?

Programming the inverter involves entering key parameters, e.g. the pressure or switching time. The inverter or controller automatically selects the optimum pump motor speed (reduces or increases speed). A constant pressure in the system increases comfort and reduces costs resulting from the operation of the pump.

Are inverters and controllers compatible with submersible and Ground pumps?

Inverters and controllers are compatible with submersible and ground pumps. The choice between controller and inverter depends on the user's personal preference and the place of application. The devices are used in: industry, domestic homes, garden and field irrigation installations, etc.

Why should you choose a pump controller & inverter?

Pump controllers and inverters ensure that costs are reduced and the life of the pump is longer. There are also advanced multifunctional control boxes that enable the selection of suitable operating parameters for pump systems. The units have many options for selection and personalisation according to user and workplace requirements.
