

Single crystal double-sided PERC module

Overview

What are PERC solar panels?

One option that outstands from the rest is the Passivated Emitter and Rear Contact (PERC) solar technology which allows for the creation of PERC solar panels. The PERC solar panel is a highly efficient and improved type of PV technology that uses Crystalline Silicon (c-Si) and fixes some inconveniences of this traditional technology.

What is the difference between PERC and n-type solar cells?

The back side of the PERC double-sided process requires laser grooving, which weakens its own mechanical properties, increases the probability of cracks and debris during the application of the power station, and seriously affects the reliability of the solar modules; while the N-type solar cell is not used in the current technology.

Can bifacial PERC solar panels be combined?

The good news for the solar industry, is that bifacial and PERC technologies can be combined, to create bifacial PERC PV cells. These new and innovative solar cells can deliver up to 18% more power than monofacial solar cells. Understanding how PERC solar panel technology works, is key to understanding the pros and cons of different applications.

How are PERC solar cells made?

Poly PERC solar cells are manufactured by blending or melting different silicon fragments together, while mono PERC solar cells are manufactured using a single silicon crystal, free from grain limits (2D defects).

What is the difference between PERC and IBC solar cells?

Efficiency for IBC solar cells is higher in general, but the highest recorded efficiency for both technologies is similar. The highest efficiency for PERC solar cells was recorded at 25.0%, while IBC solar cells achieved a 25.4%

conversion efficiency. The biggest downside for IBC technology is that it has a higher cost than PERC solar panels.

What is the difference between PERC & poly C-Si solar panels?

Poly c-Si solar cells with 18.46% efficiency get an increased efficiency of 18.61% when manufactured with PERC technology, the difference is even more notorious with mono c-Si solar cells. A traditional mono c-Si panel has a 19.55% efficiency, but this efficiency increases by 0.86% to achieve 20.41% for mono PERC solar panels.

Single crystal double-sided PERC module

[Multi Scene High Conversion Perc182 Double-sided Single ...](#)

Cell size: 182*95mm Type: PERC, Half Cell, Bifacial, Double-glass, All Black Panel
Dimensions: 2278 x1134 x 30 mm Panel
Efficiency: 21.3% Warranty: 30 years Weight: 32.3 kg Front Glass: ...
