

Single photovoltaic panel exceeds the maximum voltage

Overview

What is the maximum power voltage of a solar panel?

It is also mentioned at the back of the solar panel VOC. The maximum power voltage varies a lot because of the solar irradiance and connected load. That's why solar chargers use algorithms like MPPT (Maximum Power Point Tracking) to find the voltage to harvest maximum energy. The voltage can be 18V to 36V.

Is there a fixed voltage for a solar panel?

Therefore, there is no fixed value. It depends on the connected load and current solar irradiance. The voltage at which the solar panel is designed to operate is known as nominal voltage. It is 12V or 24V. The voltage of a solar panel mainly depends on the solar panel type, size, cells, etc.

What is the nominal voltage of a solar panel?

Generally, the nominal voltage of any solar panel is 12V or 24V. This is the voltage at which normally DC appliances operate, batteries are charged, etc. However, the nominal voltage could be 20V or 18V as well. The open circuit voltage of solar panels ranges between 21.7V to 43.2V. You can measure it by connecting a multimeter on no load.

What happens if a PV system voltage is exceeded?

If this voltage gets exceeded, damage or even worse harm can result. New technologies established a new standard, to build PV systems with voltages up to 1000V (for special purposes in big PV power plants with central inverter topology even 1500V are used).

What are the cell temperature limits for a photovoltaic system?

For the design of a photovoltaic system, the cell temperature limits established on the international market are minimum -10 °C and maximum +70 °C. Commonly these temperatures are used with the STC values of a

module for the calculation of the extreme voltages.

What happens if I add more solar panels in series?

If you add more solar panels in series the voltage of your solar array will increase. Your solar panel array must be connected to suit the inverter's maximum input requirements. The inverter has a maximum input current, for example, 40A for 40kW. Only when the input voltage exceeds 550V, will the output be likely to reach 40kW.
