

Solar System Example

Overview

There are eight planets in the solar system. The four inner terrestrial planets are Mercury, Venus, Earth, and Mars, all of which consist mainly of rock. The four outer planets are Jupiter, Saturn, Neptune, and Uranus, giant planets that consist mainly of either gases or ice.

Astronomers sometimes divide the Solar System structure into separate regions. The inner solar system includes Mercury, Venus, Earth, Mars, and the bodies in the asteroid belt. The outer solar system includes Jupiter, Saturn, Uranus, Neptune, and the bodies in the Kuiper belt. Since the discovery of the Kuiper belt, the outermost parts of the Solar System are considered a distinct region consisting of the trans-Neptunian objects.
