

# **The Middle East service is equipped with solar power generation for home use**

## Overview

---

Could solar power help the Middle East?

Experts say solar power could help the Middle East by being cost-competitive, quicker to install, and deployable at various scales. Some Middle East countries have a natural advantage when it comes to meeting power demand, harnessing their massive wealth of natural resources.

Why is the Middle East transforming its energy sector?

The Middle East's energy sector is at a turning point. Although traditionally an oil and gas powerhouse, the region is shifting its focus to renewables as a response to rapid industrial growth, increasing population, and a global drive to reduce carbon emissions.

How much energy does the Middle East use?

The Middle East's power generation is heavily reliant on fossil fuels, making up 93% of the total at the end of 2023. Renewables accounted for 3% and nuclear and hydro for 2% each. Natural-gas power represented almost three-quarters of the region's electricity generation, making up 40% of the overall gas demand.

What will the Middle East's energy landscape look like in 2050?

By 2050, renewable energy sources, including hydro in addition to solar and wind, are expected to constitute a staggering 70% of the Middle East's power generation mix. This marks a monumental leap from the mere 5% recorded at the end of 2023, signaling a transformative shift in the region's energy landscape.

How does the Middle East & North Africa strategy affect renewables?

Within the Middle East and North Africa (MENA) region, the increased industrial activity and drive towards renewables is reflected in each country's strategy. Continuous population growth and economic development have

placed pressure on existing power assets and in some cases, created a significant gap between electricity production and demand.

How much solar power will the Middle East have in 2023?

The total solar capacity in the Middle East at the end of 2023 exceeded 16 gigawatts (GW) and is expected to approach 23 GW by the end of 2024. Projections indicate that by 2030, the capacity will surpass 100 GW, with green hydrogen projects contributing to an annual growth rate of 30%.
