

# **What are the Lithuanian energy storage product standards**

## Overview

---

What is the energy storage system in Lithuania?

In July of 2021, the Government of the Republic of Lithuania appointed Energy Cells as the operator of the storage facilities for the provision of electricity from the instantaneous isolated mode reserve. Energy storage system will ensure the security of supply of Lithuania's energy system and the possibility to operate in an isolated mode.

What is Lithuania's energy policy?

This review focuses on two particularly important areas for Lithuania's energy policy. The first is how to manage the electricity system expansion needed to meet the strategic goals of the NEIS. The second is how to decarbonise the transport sector, which is the largest source of GHG emissions in Lithuania.

How can Lithuania achieve its energy goals?

This report seeks to provide Lithuania with timely advice on how it can progress towards its energy goals, including in two focus areas: expanding the electricity system and decarbonising transport. Lithuania outlines a long-term vision for an electrified energy system and new industrial development.

What is Lithuania's energy security strategy?

Since regaining national independence in 1990, Lithuania has pursued a strategy of energy security, gradually reducing its reliance on energy imports from Russia. With the completion of the Butinge oil terminal in 1999, Lithuania was able to diversify its crude oil imports.

What are the main sectors of RES development in Lithuania?

According to the National Energy Independence Strategy, there are three main sectors, where the development of RES is planned and accounted for in the National statistics of Lithuania: the electricity sector, the district heating/cooling sector, and the transport sector.

How important is the transport sector in Lithuania?

The transport sector is central for energy use and emissions in Lithuania. It accounts for around 40% of TFECE, over half of energy-related emissions and around one-third of total GHG emissions. Energy demand in the transport sector grew rapidly between 2013 and 2018, rising by 40% over five years. The trend has been more stable since 2019.
