

What is a hybrid substation

Overview

This modular approach to the construction of the substations is based on flexibility and customizability. The hybrid module can be used for extension or substitution in any traditional substation which uses an air-insulated busbar. This allows to configure the module with the components that are required by.

A hybrid is one that combines the components of traditional air-insulated switchgear (AIS) and gas-insulated switchgear (GIS) technologies. It is characterized by a compact and modular design, which.

have been traditionally distinguished according to the medium used to extinguish the arc. In the case of the hybrid switchgear modules, this device.

The term module refers to the fact that the equipment itself is a combination of different standard substation components in a single assembly. The integration allows to reduce the.

A hybrid is an advanced electrical substation that combines both conventional air-insulated switchgear (AIS) and gas-insulated switchgear (GIS) technologies to optimize performance, space utilization and cost efficiency.
